Submission Type / Conference Track: CDIO Implementation Paper

DESIGNING AUTHENTIC INDUSTRY-ENGAGED ASSESSMENT FOR PROFESSIONAL COMPETENCE IN BUSINESS INTELLIGENCE

118

Helga Ingimundardóttir 

Organisation(s): University of Iceland, Iceland

Submitted by: Dr. Helga Ingimundardóttir (University of Iceland, IS), ID: 1016

Topics: Industrial collaborations that enhance student experience and education, Curriculum development, Design-build-test experiences, Innovative learning environments

Keywords: Industry collaboration, professional competence, assessment and feedback, team-based learning

10 pages

This contribution has been conditionally accepted, pending any reviewers' comments being addressed.

Message from Chairs to Authors

This paper has been assigned to the track: CDIO Implementation

Review Results: Accept with minor changes.

The reviewers of your paper have highlighted the need for some minor revisions. Please repay their efforts by considering their suggestions when you revise your paper.

The reviewers comments are attached below.

Overview of Reviews

Questions		Review 1	Review 2	Review 3
Relevance	20%	4	5	5
Literature	15%	4	3	5
Aim or problem	15%	4	4	4
Research approach	15%	4	4	5
Originality	15%	4	3	4
Conclusions	10%	3	4	5
Coherence and Clarity	10%	4	3	5
Total points (out of 5)		3.9	3.8	4.7

4 (20%)	4 (15%)	4 (15%)	4 (15%)	4 (15%)	3 (10%)	4 (10%)	3.9

Reviewer's Comments on the Contribution

Manuscript formatting: Yes

Acceptance recommendation: Accept with changes

Track recommendation: CDIO Implementation

Contribution of the Submission:

This paper shows idea of using a structure of using assessment and feedback to drive a team-based industry-focus project in a business intelligence course.

Comments for the Authors:

Thank you for a good topic to fit with the conference theme "assessment". The author has mentioned previous works and aimed to redesign an authentic industry-driven assessment to evaluate professional competencies.

There are some points that the author can consider to improve the manuscript.

1. The author has mentioned "LOUIS" competence framework, the readers may not be familiar with this framework. So, please elaborate what it is shorten for and how it help in the teacher redesign the course.

2. In order to follow the pedagogical mechanism, Figure 1 should be moved to this section. The reader can get loss when several acronyms are used e.g. iRAT, tRAT, PR, tAPP, iREF. It will help the reader understand better if the author can

provide definitions.

3. In order to benefit more to the reader who want to use this model, an example of rubric that the author designed should be put in this paper as well.

4. The industry-engaged project structure section. Since the author mentioned that the industrial partner the students performed as expected professionally, please elaborate more what kind of feedback you collected and how the data was analyzed.

Contribution of the Submission:

It describes the redesign of an undergraduate business intelligence course to strengthen industrial relevance while supporting student professional development. It includes how the assessment and feedback were redesigned, how the individual contribution was distinguished from the team work, and how academic-industry expectation gaps were managed.

Comments for the Authors:

The paper describes a very interesting and relevant case study. Here are some recommended changes.

1. In the introduction, second paragraph, the phrase "where credibility and trust become explicit evaluation criteria" was unclear at first reading. It became clear when reading the rest of the paper. However, I recommend being more explicit at this initial point that these are industry expectations rather than academic. Also, explain how and why credibility and trust are evaluation criteria.
2. Regarding the following phrase in the redesign section: "Rubrics covering analytical soundness, transparency, reproducibility, and stakeholder relevance were applied consistently across modules and the capstone so that feedback accumulated rather than fragmenting across tasks." Please explain better how this lead to accumulated feedback. It reads as if feedback was given on each module. Does the simple fact that there were multiple instances of feedback mean that it accumulated, or is there something more significant in this?
3. Student and industry responses. Please state and discuss the class size as this might be significant in whether your approach is reproducible. I like your condensing of the evaluation into three themes but it would be interesting to compare evaluations of students, graduates, employer, academic.
4. "Authentic assessment" is in the title and a key theme of this paper. While the reader should know the meaning of "authentic" in everyday use, it might be useful to give a reference from the education literature.
5. Some formatting changes are needed to align with the CDIO template:
 - (1) Second-level sub-headings (e.g. Professional Competence in a CDIO Perspective) should have only the initial word capitalised.
 - (2) The figure caption might need to be centred (although I'm not sure on this one - please check).
 - (3) Journal title to be capitalised (Education Next).
 - (4) The Michaelsen, L., Knight, A., & Fink, L. reference - the publisher should be Routledge.
 - (5) Within the main body of the paper, "et al." should be in italics.
 - (6) References in the main body should use the ampersand rather than "and" where appropriate, e.g. Hansen & Sindre, 2023.
 - (7) The footer should not be in italics and the 22 (in 22nd) should look the same as the 22 in the date.

Reviewer's Comments on the Contribution

Manuscript formatting: Yes

Acceptance recommendation: Accept as is

Track recommendation: CDIO Implementation

Contribution of the Submission:

A good case of how a course can be redesigned by reconfiguring assessment and feedback to support professional competence in authentic industry-engaged settings.

Comments for the Authors:

Thank you for a well written, relevant paper clearly anchored in the CDIO framework with valuable lessons learned, together with transferable design principles for CDIO programs.
